

A Look at Forklift Parts

Article by: Thomas Morva

There are several components that all forklifts have in common. These forklift parts are vital to the operation of the equipment. Forks, brake components, and transmissions are some of the parts that are purchased most often.

Forklift parts can be purchased from several sources. Both new and used parts are usually available wherever forklifts are sold. Many dealerships have extensive catalogues that list the parts they have available. There are a number of different manufacturers of forklift parts. The same company that made the forklift can make the replacement parts or a generic maker can manufacture them.

The forks are possibly the most important component of the forklift. Without quality forks, the lift is not able to transport cargo efficiently. The forks, also called blades or tines, vary greatly from model to model. Most forks are made of steel. Forks differ in the amount of weight they can handle. Weaker model forks can safely lift 900 pounds, while heavy-duty forks are capable of lifting several tons. It is important to note that a forklift's weight capacity depends on much more than just the forks. The engine size and the strength of the lifting system also play important roles in determining how much a forklift can safely carry.

Forklift brake parts are other important parts. Forklift brakes operate in a similar manner to the brakes of an automobile and they have many parts in common. Brake shoes and break drums are among the most commonly purchased forklift brake parts.

Forklift transmissions are vital to the machine's operation. Forklifts can use either manual or automatic transmissions. Manual transmissions are probably more common and are easier to fix, but many people prefer automatic transmissions because they are easier to use. Many forklift parts dealers have both new and used transmissions for sale.

Buying good replacement forklift parts is a great way to keep the machine functioning properly. Many forklift parts dealers offer extensive warranties on their products. Forklift parts are available for nearly every make and model, so it should not be too hard to find the necessary parts. Forklifts Info provides detailed information about forklifts, including rough terrain and truck-mounted forklifts, used forklifts, and forklifts for sale, as well as forklift parts, accessories, operators, and safety.
